Research shows Wolf Trax DDP micronutrients provide consistent results under toughest conditions

Winnipeg – Sept. 20, 2004 – Wolf Trax has released its @farmtested™ Research and Evaluation Results which demonstrate how Wolf Trax DDP™ (Dry Dispersible Powder) micronutrients provide consistent results under the toughest conditions, regardless of crop or geography.

The data produced by this industry leading research effort is now available in one easy-to-use publication.

“Wolf Trax conducts one of the most extensive research and evaluation programs for micronutrients,” said Kerry Green, Technical Director for Wolf Trax. “We put our products to the test in several countries, and across varying soil conditions, climatic conditions and crops. All our efforts are focused on developing research-proven plant nutrition technology for the agricultural and horticultural industry.”

The @farmtested Research and Evaluation Results show how Wolf Trax DDP micronutrients correct deficiencies, regardless of crop or geography. The @farmtested results also illustrate Wolf Trax DDP micronutrients’ strong quality and safety performance.

According to Green, these research efforts prove that Wolf Trax offers dramatically different technology – in fact, the first new micronutrient technology in nearly three decades. “Our extensive testing and evaluation shows that DDP products provide superior application and improved uptake. And our quality testing shows how our products meet the strictest standards for cleanliness, low heavy metal content and quality,” adds Green.

Wolf Trax carries a full line of DDP micronutrients, which all contain the unique Dual Action™ formulation. This means that they are immediately available, and also provide continuous feeding for the plant.

More ...

Dual Action provides access to micronutrients when they're needed most by the growing plant. The DDP formulation combines the best features of sequestered micronutrient products, which are known for how quickly they are available, with the later availability of suspension formulations.
